Introducing a safety door switch with solenoid interlock that is among the world's thinnest*!
With 5 built-in contacts ${ }^{\text {Basesed of research oonducted by our company y of of }}$ March 2013.

Manual lock release can be operated from three directions.

Space saving design with angled connection cable

## All models come with cables pre-installed.

The SG-B1 series and SG-A1 series ship with bundled cables already connected internally. Since there is no need to provide cables separately, and because they are already connected internally, the number of wiring man-hours is cut in half.

## Energy-saving design

The SG-B1 series features an energy-saving design requiring current consumption of just 110 mA at 24 V DC ( 100 mA for the solenoid and 10 mA for the indicator), even though it also incorporates a solenoid interlock.

Low power consumption of 110 mA

Can be installed on any door.

Actuators
Actuators are not included with door switches and must be purchased separately.

| Type | Model No. |
| :--- | :--- |
| Straight actuator | SG-K11 |
| Right-angle actuator | SG-K12 (Note 1) |
| Right-angle actuator (with plate) | SG-K12A |
| Horizontal / vertical angle <br> adjustable actuators (Note 2) | SG-K13 |
|  | SG-K14 |

-SG-K11

- SG-K13

- SG-K14

2) Choose a model after verifying the required direction of operation based on the relationship between the door and safety switch. (Refer to P.21)
The right-angle SG-K12 actuator's tensile strength is 100 N . Using the device with a load in excess of this value may cause it to fall off the door. If you anticipate that the tensile load during use will exceed 100 N , use the right-angle (with plate) SG-K12A.

Solve issues related to machine safety and other
safety measures with a safety door switch with key!

The safety door switch with key SG-B2 series locks and unlocks doors with keys.
When an operator takes a key into a hazardous area, the safety door switch will not lock, and the equipment will stop, ensuring operator safety by preventing personnel from being closed inside the hazardous area and preventing equipment from starting to operate.

Additionally, the key selector switch SG-D1 series can be used to switch equipment modes and unlock door locks with a single key.

## Energy-saving design, no power supply required

Since doors are locked and unlocked with a key, there is no need to supply power to the safety door switch.

## Head removal detection function

Head removal detection function is employed in the SG-B2. With this innovative function, the monitor circuit (41-42) turns off when the head is removed from the switch, such as when removing the head to change the head direction.
With the head installed on the switch, monitor circuits 41-42 and 51-52 operate in synchronization while the key locks/unlocks the actuator. When the head is removed, 41-42 turns off and 51-52 turns on.
This disagreement is detected by the head removal detection function.

| Monitor circuit | Actuator unlocked | Actuator locked | When the head removed |
| :---: | :---: | :---: | :---: |
| lock Q unlock |  |  |  |
| Monitor circuit (NC) Pink $\Theta 41 \begin{aligned} & \text { a } \\ & 42\end{aligned}$ | OFF | ON | OFF |
| Monitor circuit (NC) Brown $\Theta$ 51 ${ }^{\text {c }}$ ( 52 Brown / White | OFF | ON | ON |

Note: Head removal detection function is not direct opening.

## High-security pin tumbler key types are used

All models come with cables pre-installed.

Double-insulated design eliminates the need for grounding wires.

Choose an actuator based on the door shape and application.

## Available with rear unlocking button

Models with a rear unlocking button allow the door to be unlocked from the inside in the event a worker is left in the hazardous area.

## Equipment combination examples related to machine safety

Safety controllers incorporate safety circuit logic that complies with ISO 13849-1 PLe requirements, making it easy to build safety circuits that support a variety of equipment without the need to create programs.

Key selector switch SG-D1 series

## Use in combination with the safety door switch with key SG-B2 series to enable hostage control.

Hazards of the system and robot are isolated by the safety guard. When a worker needs to work inside the hazardous area for maintenance, the worker unlocks the safety guard using a key, disables the system from starting (1), removes the key and brings it into the hazardous area, and then changes the operation mode of each system to maintenance mode (2). While the worker is carrying out maintenance work in the hazardous area, the safety guard cannot be locked and the system cannot be turned on. This enables the worker to work safely in the hazardous area.

* Hostage control: The safety measure using a hostage key is called hostage control.

Compact, lightweight grip switches designed to fit comfortably in the hand

This product line includes models with control units suited to a variety of applications.

The compact, lightweight grip profile was designed based on human engineering considerations.
The compact profile fits the hand perfectly, ensuring comfortable operation. Thanks to its lightweight design (SG-C1-21: approx. 140 g ) and compact size, it is easy to hold even for individuals with small hands, and it can also be used in confined work locations.

## Reduced impact during extended operation

We reduced the impact during extended operation by lowering the holding load in position 2 (ON).

## Pleasant, clear button operation

Tactile clicking feedback allows easy recognition of switch operation when shifting from position 1 (contact OFF) to position 2 (contact ON).

## SEMI semiconductor industry safety standards

SEMI standards comprise a series of guidelines put together by an industry group consisting of manufacturers of semiconductor manufacturing equipment, flat-panel displays, and associated materials. In the semiconductor industry, this guidelines have achieved the status of de facto international standards.

Section 12.1 of the SEMI standards (S2 0706) states, "Equipment should incorporate an emergency off (EMO) circuit. When the EMO actuator (button) is triggered, the equipment should transition to a safe state in which no new hazard is posed to workers or equipment." This provision likely stems from the need to address the possibility of secondary hazards that could occur when processing power and other inputs are stopped, reflecting the industry's extensive use of materials such as solvents and chemicals, many of which contain hazardous or toxic substances. Consequently, SEMI standards require that normal emergency stop switches, which shut off the supply of energy, including power, be augmented with separate emergency off switches that shut off only the portion of the load that created the hazardous state while maintaining operation of other safety-related equipment (smoke detectors, gas/ water leak detectors, pressure measurement equipment, etc.).

When there is the possibility that the emergency off switch could be operated mistakenly, a guard must be installed and the switch must use direct opening operation. The button must be red with a yellow background, and the switch itself must include the letters "EMO."

- When installing a SEMI emergency off (EMO) switch on semiconductor manufacturing equipment, it should be installed at a height of 838 to $1,638 \mathrm{~mm} 32.992$ to 64.488 in .
(SEMI S8-0705)
- According to SEMI standards, the EMO emergency stop switch must be installed within 3 m 9.843 ft of the work location.
(SEMI S2-0706 12.5.2)

Main circuit: Connected to the machine drive control circuit, sending the interlock signals of the protective door.
Monitor circuit: Sends the monitoring signals of open / closed and lock / unlocked statuses of the protective door.
Notes: 1) Do not attempt manual unlocking while the solenoid is energized.
2) Do not energize the solenoid for a long period of time while the door is open or while the door is unlocked manually.

- Operation characteristics $\square$ : Contact ON (closed) $\square$ : Contact OFF (opened)

The characteristics show the contact status when the actuator enters an entry slot of an safety switch.
The characteristics shown in the chart above are of the SG-K11, 12, 13 and 14 actuators. For the SG-K12S actuator, subtract 0.6 mm.

## Precautions for proper use

－This catalog is a guide to select a suitable product Be sure to read the instruction manual attached to the product prior to its use．
－In order to avoid electric shock or fire，turn the power off before installation，removal，wire connection，maintenance，or inspection of the safety switch．
－If relays are used in the circuit between the safety switch and the load，consider the danger and use safety relays，since welding or sticking contacts of standard relays may invalidate the functions of the safety switch．
－Do not place a PLC in the circuit between the safety switch and the load．Safety and security can be endangered in the event of a malfunction of the PLC．
－Do not disassemble or modify the safety switch， otherwise a breakdown or an accident may occur．
－Do not install the actuator in a location where the human body may come in contact．Otherwise injury may occur．
－Magnet lock type is locked when energized，and unlocked when de－energized．When energization is interrupted due to wire disconnection or other failures，the safety switch may be unlocked causing possible danger to the operators．Magnet lock type must not be used in applications where locking is strictly required for safety．Perform a risk assessment and determine whether solenoid lock type is appropriate．

## Both series

－Regardless of door types，do not use the safety switch as a door stop．Install a mechanical door stop at the end of the door to protect the safety switch against excessive force．
－Do not apply external force on the actuator while unlocking， otherwise the actuator may not be unlocked．
－Do not apply excessive shock to the safety switch when opening or closing the door．A shock to the safety switch exceeding $1,000 \mathrm{~m} / \mathrm{s}^{2}$ may cause damage to the safety switch．
－If the operating atmosphere is contaminated，use a protective cover to prevent the entry of foreign objects into the safety switch through the actuator entry slots．Entry of a considerable amount of foreign objects into the safety switch may affect the mechanism of the safety switch and cause a malfunction．
－Do not store the safety switches in a dusty，humid，or organic－gas atmosphere，or in an area subjected to direct sunlight．
－Use proprietary actuators only．When other actuators are used， the safety switch may be damaged．

## SG－B1 series

－The locking strength is rated at 500 N．Do not apply a load higher than the rated value．When a higher load is expected，provide an additional system consisting of another safety switch without lock （such as the SG－A1 safety switch）or a sensor to detect door opening and stop the machine．
－Regardless of door types，do not use the safety switch as a door lock．Install a separate lock using a latch or other measures．
－While the solenoid is energized，the switch temperature rises approximately $35^{\circ} \mathrm{C} 95^{\circ} \mathrm{F}$ above the ambient temperature（to approximately $85^{\circ} \mathrm{C} 185^{\circ} \mathrm{F}$ while the ambient temperature is $50^{\circ} \mathrm{C}$ $122^{\circ} \mathrm{F}$ ）．Do not touch to prevent burns．If cables come into contact with the switch，use heat－resistant cables．
－Bouncing will occur on the lock monitor contact during locking and unlocking（reference value： 20 ms ）．
－Although the SG－K11／SG－K12／SG－K12A actuators alleviate shock when the actuator enters a slot in the safety switch，make sure that excessive shock is not applied．If the rubber bushings become deformed or cracked，replace with new ones．

## SG－A1 series

－Cover the unused actuator entry slot using the slot plug supplied with the safety switch．

## Minimum radius of hinged door

－When using the safety switch on hinged doors，refer to the minimum radius of doors shown below．When using on doors with small minimum radius，use the angle adjustable actuator（SG－K13 ／SG－K14）．
Note：The values indicated in the figures below assume that there is no mechanical interference between the actuator and the safety switch when the door is opened or closed．Because deviation or dislocation of hinged doors may occur in actual applications，make sure of the correct operation before installation．

## When using the right－angle actuator（SG－K12／SG－K12A）

## SG－B1 series

＜When the door hinge is on the extension line of the actuator mounting surface＞

＜When the door hinge is on the extension line of the safety switch surface＞

## SG－A1 series

＜When the door hinge is on the extension line of the actuator mounting surface＞

＜When the door hinge is on the extension line of the safety switch surface＞

## Precautions for proper use

## When using the (SG-K13 / SG-K14) angle adjustable (vertical / horizontal) actuator

- When the door hinge is on the extension line of the actuator mounting surface: 70 mm 2.756 in
- When the door hinge is on the extension line of the safety switch surface: 50 mm 1.969 in

## SG-B1 series

<When the door hinge is on the extension line of the actuator mounting surface>

## SG-A1 series

<When the door hinge is on the extension line of the actuator mounting surface>

<When the door hinge is on the extension line of the safety switch surface>

## Actuator angle adjustment (vertical / horizontal)

- Using the angle adjustment screw (M3 hexagon socket head screw), the actuator angle can be adjusted. (refer to the dimensions on page 24)
Adjustable angle: 0 to $20^{\circ}$
- The larger the adjusted angle of the actuator, the smaller the applicable radius of the door opening. After installing the actuator, open the door. Then adjust the actuator so that its edge can be inserted properly into the actuator entry slot of the safety switch.
- After adjusting the actuator angle, apply Loctite to the adjustment screw so that the screw will not move.

## Mounting

- Mount the safety switch on a fixed piece of machinery or guard and the actuator on a hinged door. Avoid mounting both the safety switch and actuator on a hinged door. Doing so may cause equipment failure. For more information about how to mount the devices, see the following diagram:

Note: When mounting the actuator, make sure that the actuator $\square \square$ enters the slot in the correct direction, as shown on the right figure.

Recommended tightening torque for mounting screws Safety switch: 1.0 to $1.5 \mathrm{~N} \cdot \mathrm{~m}$ (Three M4 screws)* Actuator: 1.0 to $1.5 \mathrm{~N} \cdot \mathrm{~m}$ (two M4 screws)*
*The above recommended tightening torques of the mounting screws are the values confirmed with hex socket head bolts. When other screws are used and tightened to a smaller torque, make sure that the screws do not become loose after mounting.

- Mounting bolts must be provided by the users.
- To avoid unauthorized or unintended removal of the safety switch and the actuator, it is recommended that the safety switch and actuator are installed in a secure manner, for example using special screws or welding the screws.
- When installing the SG-K12A actuator, use the mounting plate (supplied with the actuator) on the hinged door, and mount tightly using two M4 screws.
The mounting plate has orientation. Do not lose the mounting plate. Adequate performance cannot be obtained without the plate as the actuator may fall off the door.

Cables

- Do not fasten or loosen the gland at the bottom of the safety switch.
- When bending the cable during wiring, make sure that the cable radius is kept at 30 mm 1.181 in minimum.
- When wiring, make sure that water or oil does not enter the cable.
- The solenoid has polarity. Make sure of the correct polarity when wiring.

## SG-B1 series

SG-A1 series

SG-B1 ${ }_{\text {serifes }}$ / SG-A1 $1_{\text {series }}$

## Dimensions (Unit: mm in)

When using straight actuator (SG-K11)

When using the right-angle actuator (SG-K12A)

When using the angle adjustable actuator (horizontal / vertical)
(SG-K13 / SG-K14)

Notes: 2) The actuator stop is used to adjust the actuator position. Remove the actuator stop after the actuator position is mounted. 3) 41.41 .63 when using SG-K12A

* The tensile strength of the SG-K12A actuator is 100 N .

When tensile force exceeding 100 N is expected, use the SG-K12A actuator, which has a mounting plate.

## Actuator mounting reference position

As shown in the figure on the right, the mounting reference position of the actuator when inserted in the safety switch is:
The actuator stop on the actuator lightly touches the safety switch.

* The actuator stop is used to adjust the actuator position. Remove the actuator stop after the actuator position is mounted.

SG-B1series / SG-A1series
Dimensions (Unit: mm in)

SG-A1■ Safety door switch
Mounting hole layout

Note 2: The actuator stop is used to adjust the actuator position. Remove the actuator stop after the actuator position is mounted.

SG-K11 / SG-K12 / SG-K12A actuator

Straight actuator (SG-K11)

## Right-angle actuator (SG-K12)

* The tensile strength of the SG-K12 actuator is 100 N .

When tensile force exceeding 100 N is expected, use the SG-K12A actuator, which has a mounting plate.

Note: The actuator stop is used to adjust the actuator position. Remove the actuator stop after the actuator position is mounted.

Actuator mounting hole layout (Straight actuator, right-angle actuator)

SG-B1 ${ }_{\text {serifes }}$ / SG-A1 $1_{\text {series }}$

## Dimensions (Unit: mm in)

## SG-K13 / SG-K14 actuator <br> Horizontal / vertical angle adjustable actuators (SG-K13)

## (Horizontal adjustment)

Horizontal / vertical angle adjustable actuators (SG-K14)

* The SG-K14 differs from the SG-K13 in that the direction in which the metal parts on the tip of the actuator are embedded is reversed by $180^{\circ}$.
(Horizontal adjustment)
Angle adjustment (M3 hexagon socket head screw)

(Vertical adjustment)

Changes in the orientation of adjustment for angle adjustable (horizontal / vertical) actuators
The orientation of actuator adjustment (horizontal / vertical) can be changed using the orienting insert (white plastic) installed on the back of the actuator. Do not lose the mounting plate.

* The base is made of glass-reinforced PA66 (66 nylon). Angle adjustment screws are stainless steel.

When using adhesive on screws, take material compatibility into consideration.
Note: The actuator stop is used to adjust the actuator position. Remove the actuator stop after the actuator position is mounted.

Actuator mounting hole layout (horizontal / vertical angle adjustable actuators)

Notes：1）Ratings approved by UL，c－UL： 125 V
2）Basic insulation of 2.5 kV impulse withstand voltage is ensured between different contact circuits． When both SELV（safety extra low voltage）or PELV（protective extra low voltage）circuits and other circuits（such as 230 V AC circuits） are used for the solenoid power and contact circuits at the same time，the SELV or PELV requirements are not met any more．
3）The actuator locking strength is rated at $1,400 \mathrm{~N}$ of static load．Do not apply a load higher than the rated value．When a higher load is expected to work on the actuator，provide an additional system consisting of another safety switch without lock（such as the SG－A1 safety switch）or a sensor to detect door opening and stop the machine．

## Precautions for proper use

－This catalog is a guide to select a suitable product． Be sure to read the instruction manual attached to the product prior to its use．

> - In order to avoid electric shock or fire, turn the power off before installation, removal, wire connection, maintenance, or inspection of the safety switch.
> - If relays are used in the circuit between the safety switch and the load, consider the danger and use safety relays, since welding or sticking contacts of standard relays may invalidate the functions of the safety switch.
> - Do not place a PLC in the circuit between the safety switch and the load. Safety and security can be endangered in the event of a malfunction of the PLC.
> - Do not disassemble or modify the safety switch, otherwise a breakdown or an accident may occur.
> - Do not install the actuator in a location where the human body may come in contact. Otherwise injury may occur.
－Regardless of door types，do not use the safety switch as a door stop．Install a mechanical door stop at the end of the door to protect the safety switch against excessive force．
－Do not apply excessive shock to the safety switch when opening or closing the door．A shock to the safety switch exceeding $1,000 \mathrm{~m} / \mathrm{s}^{2}$ may cause damage to the safety switch．
－If the operating atmosphere is contaminated，use a protective cover to prevent the entry of foreign objects into the safety switch through the actuator entry slots．Entry of a considerable amount of foreign objects into the safety switch may affect the mechanism of the safety switch and cause a malfunction．
－Cover the unused actuator entry slot using the slot plug supplied with the safety switch．
－Do not store the safety switches in a dusty，humid，or organic－gas atmosphere，or in an area subjected to direct sunlight．
－Use proprietary actuators only．When other actuators are used， the safety switch may be damaged．
Do not cut，machine，or otherwise modify actuators．Doing so may cause equipment failure．
－Do not open the lid of the safety switch．Loosening the screws may damage the safety switch．
－The locking strength is rated at $1,400 \mathrm{~N}$ ．Do not apply a load higher than the rated value．When a higher load is expected， provide an additional system consisting of another safety switch without lock or a sensor to detect door opening and stop the machine．
－Regardless of door types，do not use the safety switch as a door lock．Install a separate lock using a latch or other measures．
－Although the SG－K21A／SG－K22A actuators alleviate the shock when the actuator enters the slot on the safety switch，make sure that excessive shock is not applied．If the rubber bushings become deformed or cracked，replace with new ones．

## Precautions for proper use

- Do not mount the safety switch facing down as shown in the figure below. Otherwise, the key may fall off due to shock.

## Cables

- Do not fasten or loosen the gland at the bottom of the safety switch.
- When bending the cable during wiring, make sure that the cable radius is kept at 30 mm 1.181 in minimum.
- When wiring, make sure that water or oil does not enter the cable.
- Do not open the lid of the safety switch. Otherwise the safety switch will be damaged.

## Minimum radius of hinged door

When using the safety switch on hinged doors, refer to the minimum radius of doors shown below. When using on doors with small minimum radius, use the angle adjustable actuator (SG-K24). Note: Because deviation or dislocation of hinged doors may occur in actual applications, make sure of the correct operation before installation.

When using the right-angle actuator (SG-K22)
<When the door hinge is on the extension line of the actuator mounting surface>

<When the door hinge is on the extension line of the safety switch surface>

When using the right-angle actuator (with rubber bushings) (SG-K22A) <When the door hinge is on the extension line of the actuator mounting surface>

<When the door hinge is on the extension line of the safety switch surface>

## Actuator angle adjustment (vertical / horizontal)

- Using the angle adjustment screw (M3 hexagon socket head screw), the actuator angle can be adjusted. (refer to the dimensions on page 29)
Adjustable angle: 0 to $20^{\circ}$
- The larger the adjusted angle of the actuator, the smaller the applicable radius of the door opening. After installing the actuator, open the door. Then adjust the actuator so that its edge can be inserted properly into the actuator entry slot of the safety switch.
- After adjusting the actuator angle, apply Loctite to the adjustment screw so that the screw will not move.

## When using the angle adjustable actuator (SG-K24)

- When the door hinge is on the extension line of the actuator mounting surface: 70 mm 2.756 in
- When the door hinge is on the extension line of the safety switch surface: 50 mm 1.969 in
<When the door hinge is on the extension line of the actuator mounting surface> (Horizontal adjustment) (Vertical adjustment)

<When the door hinge is on the extension line of the safety switch surface> (Horizontal adjustment)
(Vertical adjustment)

Mounting

- Mount the safety switch on a fixed piece of machinery or guard and the actuator on a hinged door.
Avoid mounting both the safety switch and actuator on a hinged door. Doing so may cause equipment failure. For more information about how to mount the devices, see the following diagram:

Recommended tightening torque for mounting screws

- Recommended screw tightening torque

|  | Screw tightening torque |
| :---: | :---: |
| For mounting the safety switch (M4 screw) (Note 1) | 1.8 to $2.2 \mathrm{~N} \cdot \mathrm{~m}$ |
| For mounting the actuator <br> (SG-K21 : two M4 screws) (Note 1) <br> (SG-K21A / SG-K22A : two M4 screws) (Note 1) (Note 2) <br> (SG-K21S : M5 screw) (Note 1) <br> (SG-K22 : two M4 phillips screws) <br> (SG-K24 : two M4 screws) (Note 1) | 1.8 to $2.2 \mathrm{~N} \cdot \mathrm{~m}$ 1.0 to $1.5 \mathrm{~N} \cdot \mathrm{~m}$ 4.5 to $5.5 \mathrm{~N} \cdot \mathrm{~m}$ 0.8 to $1.2 \mathrm{~N} \cdot \mathrm{~m}$ 1.0 to $1.5 \mathrm{~N} \cdot \mathrm{~m}$ |
| For mounting the SG-B2 head (M3) | 0.9 to $1.1 \mathrm{~N} \cdot \mathrm{~m}$ |
| For mounting the manual rear unlocking button (M3 sems screw) | 0.5 to $0.7 \mathrm{~N} \cdot \mathrm{~m}$ |
| Notes: 1) The above recommended tightening torques of the mounting screws are the values confirmed with hex socket head bolts. When other screws are used and tightened to a smaller torque, make sure that the screws do not come loose after mounting. <br> 2) In the case of SG-K21A or SG-K22A, using two M4 screws and two attached washers, fasten the |  |

```

Right-angle actuator (SG-K22)

Right-angle actuator with rubber bushings (SG-K22A)

Slide actuator (SG-K21S)

Horizontal / Vertical angle adjustable actuators (SG-K24)

Changes in the orientation of adjustment for angle adjustable (vertical / horizontal) actuators

The orientation of adjustment of angle adjustable (vertical / horizontal) actuators is determined by the position in which the orienting insert (white plastic) is installed on the back of the actuator. Install the insert according to the desired orientation of adjustment. Exercise care not to lose the orienting insert. The actuator will not operate properly without the orienting insert.

Actuator mounting hole layout horizontal / vertical angle adjustable actuators

Angle adjustable screw

Note: The actuator stop is used to adjust the actuator position. Remove the actuator stop after the actuator position is mounted.

MS-SG21 Mounting plate (Optional)

Note: With the mounting hole dimension, the rear unlocking button rod does not touch the hole even when the safety switch moves sideways.

MS-SG-22 / MS-SG-23 Rear unlocking button kit (Optional)

Note: With the mounting hole dimension, the rear unlocking button rod does not touch the hole even when the safety switch moves sideways.

## Precautions for proper use

- This catalog is a guide to select a suitable product. Be sure to read the instruction manual attached to the product prior to its use.
- In order to avoid electric shock or fire, turn the power off before installation, removal, wire connection, maintenance, or inspection of the safety switch.
- Do not disassemble or modify the grip switch.
- When using the SG-C1 series for safety-related equipment in a control system, refer to the safety standards and regulations in each country and region depending on the application purpose of the actual machines and installations to make sure of correct operation. Also, perform risk assessment to make sure of safety before starting operation.
- Do not tie the grip switch around the button with a tape or string to keep the switch in position 2. Doing so will prevent the grip switch from functioning as designed and is extremely dangerous. Systems that stop operation after the grip has been operated for a certain period of time and require the operator to grip it again are effective in preventing circumvention of the device's intended purpose.
- Please note that permanent installation of the grip switch at the machine is inadmissible.
- Use proper size wires to meet voltage and current requirements.
- Do not apply an excessive shock to the SG-C1 series.
- When wiring, prevent dust, water, or oil from entering the grip switch.
- If used in wet locations, this device must be used with cable suitable for wet locations.
- When multiple safety components are connected in series, the EN ISO 13849-1 performance level will fall due to the deterioration in fault detection functionality.
- The suitability of control systems in which this product has been embedded must be verified in accordance with EN ISO 13849-2.
- SG-C1 series is a device used for enabling a machine (robot, etc.) when teaching the machine in a hazardous area manually. Configure the enabling system so that the machine can operate when the switch is in position 2 and an additional "start" is pushed to initiate the operation.
- In order to ensure safety of the control system, connect each pair of the contacts of the 3 position enabling switch (terminal No. NO1-C1 and NO2-C2) to a discrepancy detection circuit such as a safety relay module.
(ISO13849-1)
- The base and the plastic part of rubber boot frame are made of glass-rainforced ABS / PBT. The rubber boot is made of silicone rubber. The screw is made of iron. When cleaning the SG-C1 series, use a detergent compatible with the materials
- As for momentary pushbutton switch and key selector switch of additional control unit, do not connect NO and NC contacts of a microswitch to different voltages or different power sources to prevent a dead short-circuit.
- Do not operate key selector switch of additional control unit without completely insertion of the key.
- The rubber boot may deteriorate depending on the operating environment and conditions.

## Cable glands

- The product includes one cable gland. When purchasing replacements, ensure that they conform to the following dimensional range:
- Dimension diagram

- Waterproofness: Use a cable gland that can maintain performance of IP67 or higher.
- Recommended connector: Model SKINTOP-BS-M16 $\times 1.5-\mathrm{B}$ (manufactured by LAPP in Germany and imported by K.mecs Co., Ltd.)
- Applicable cable diameter: Outer diameter of 4.5 to 10 mm 0.177 to 0.787 in

SG-C1 serifs

## Precautions for proper use

## Wire length inside the grip switch

| Wire stripping | Grip switch |  |  |  |  |  | Momentary pushbutton switch I Key selector switch |  |  | Emergency stop switch |  | Indicator |  |

|  | N01 | C1 | 31 | 32 | N02 | C2 | C | NO | NC | 1 |  | + | - |
| ( mm in | $\begin{aligned} & \hline 40 \\ & 1.575 \\ & \hline \end{aligned}$ |  |  | $\begin{array}{\|c} \hline 60 \\ 2.362 \\ \hline \end{array}$ | $\begin{array}{\|c\|} \hline 85 \\ 3.346 \end{array}$ | $\begin{array}{\|c\|} \hline 80 \\ 3.50 \end{array}$ | $\begin{gathered} 120 \\ 4.724 \end{gathered}$ |  |  | $\begin{gathered} 110 \\ 4.331 \end{gathered}$ |  | $\begin{array}{r} 115 \\ 4.528 \\ \hline \end{array}$ |  |

Applicable wire size in terminal

- If direct-mounted: $0.5 \mathrm{~mm}^{2}$ (AWG20) or less

Wire SG-C1 series according to IEC60204-1 Wiring Instruction

## Wiring

- Solder the terminal at 310 to $350{ }^{\circ} \mathrm{C} 590$ to $662^{\circ} \mathrm{F}$ within 3 seconds using a 60 W soldering iron.
$\mathrm{Sn}-\mathrm{Ag}-\mathrm{Cu}$ type is recommended when using lead free solder.
- When soldering, do not touch the SG-C1- $\square$ with the soldering iron. Also ensure that no tensile force is applied to the terminal. Do not bend the terminal or apply excessive force to the terminal.
- Use non-corrosive rosin flux.
- Because the terminal spacing is narrow, use protective tubes or heat shrinkable tubes to avoid burning of wire coating or short circuit.
- When using a stranded wire, make sure that adjoining terminals are not short-circuited with protruding core wires.
- Use copper wire 60 to $75^{\circ} \mathrm{C} 140$ to $167^{\circ} \mathrm{F}$ only. (UL508)
- The wiring has to be installed according to GS-ET-22, 4.2.6.

Recommended screw tightening torque

| Part being secured | Screw <br> position | Screw tightening <br> torque |
| :--- | :---: | :--- |
| For mounting rubber <br> boot frame on the <br> base $(\mathrm{M} 4$ screw $\times 4)$ | A | 1.1 to $1.3 \mathrm{~N} \cdot \mathrm{~m}$ |
| Cable gland to Grip <br> switch Screw | B | 2.7 to $3.3 \mathrm{~N} \cdot \mathrm{~m}$ |
| Cable gland to cable <br> gland | C | 2.7 to $3.3 \mathrm{~N} \cdot \mathrm{~m}$ |

The $B$ and $C$ values in the above table reflect use of the recommended connectors listed above.
When using a cable gland other than the recommended model, check that part's tightening torque.

|  | cessory | Lever lock: 1 pc |  |  |  |  |  |  |  |

## Precautions for proper use

- In order to avoid electric shock or fire, turn the power off before installation, removal, wire connection, maintenance, or inspection of the safety switch.
 - Use wiring that is appropriate for the applied voltage and energized current, and tighten terminal screws (M3.5) to the recommended tightening torque ( 1.0 to $1.3 \mathrm{~N} \cdot \mathrm{~m}$ ). Using the switch when the screws are loose will cause it to become extremely hot, posing the risk of fire.

Mounting hole layout / minimum mounting center
 When using the safety lever lock, determine the vertical spacing* in consideration of convenience for installing and removing the safety lever lock. (Recommended vertical spacing: 100 mm 3.937 in or more)

The $3.2^{+02} 0.126^{+0008}$ recess is for preventing rotation and not necessary when anti-rotation is not used. When anti-rotation is not required or when the panel cut-out does not have anti-rotation recess, remove the "Projection" using pliers.

- The minimum mounting centers are applicable to switches with one layer of contact blocks (two contact blocks).
When two layers of contact blocks are mounted, determine the minimum mounting centers in consideration of convenience for wiring.

## Applicable wiring

(1) The applicable wire size is $2 \mathrm{~mm}^{2}$ maximum. (single wire $\varnothing 1.6$ $\mathrm{mm} ø 0.063$ in maximum) One or two wires can be connected.

- Applicable crimping terminal (Unit: mm in) When using direction (A)

When using direction (B)

Be sure to use an insulation tube or cover on the crimping part of the crimping terminal to prevent electrical shocks.

- Single wire (Unit: mm in)

Note: When connecting wires to contact blocks or transformers in the direction (B), keep the insulation stripping length 6.6 mm 0.260 in at the maximum.
(2) Tighten the M3.5 terminal screws to a torque of 1.0 to $1.3 \mathrm{~N} \cdot \mathrm{~m}$.

## Using the lever lock

- Panasonic Industrial Devices SUNX strongly recommends using the lever lock (yellow) to prevent heavy vibration or maintenance personnel from unlocking the contact assembly.

SG-E1 series

## Dimensions (Unit: mm in)

SG-E1-ם Emergency stop switch

Note: Please attach the lever lock (yellow) after locking to prevent personnel from forgetting to lock the lock lever.

SG-E1-a-E SEMI emergency off (EMO) switch

Note: Please attach the lever lock (yellow) after locking to prevent personnel from forgetting to lock the lock lever.

SG-EP $\square \quad$ Emergency stop nameplate (Optional)

MS-SG-GR1 SEMI guard ring (Optional)

Note: When anti-rotation is not required, remove the projection from the switch gurad using pliers.

## SG-ET1 Locking ring wrench (Optional)

Height of SEMI emergency off (EMO) switch and SEMI guard ring As illustrated below, the height of the SEMI emergency off (EMO) switch and SEMI guard ring should be 3 mm 0.118 in or less.

## - Note

The EMO switch and the guard ring have been designed for applications in semiconductor manufacturing equipment only. Do not use EMO switch and/or the guard ring which are installed on machine tools or food processing machines.
(Machinery Directive of the European Commission and IEC 602041 require that emergency stop switches be installed in a readily accessible area and the usage of switch guards is not permitted.)

Key selector switch

## Precautions for proper use

- In order to avoid electric shock or fire, turn the power
off before installation, removal, wire connection,
maintenance, or inspection of the safety switch.
- Use wiring that is appropriate for the applied
voltage and energized current, and tighten terminal
screws (M3.5) to the recommended tightening
torque ( 1.0 to $1.3 \mathrm{~N} \cdot \mathrm{~m}$ ). Using the switch when the
screws are loose will cause it to become extremely
hot, posing the risk of fire.

Mounting hole layout / minimum mounting center

When using the safety lever lock, determine the vertical spacing* in consideration of convenience for installing and removing the safety lever lock. (Recommended vertical spacing: 100 mm 3.937 in or more)

The $3.2^{+00^{2}} 0.126^{+0008}$ recess is for preventing rotation and not necessary when anti-rotation is not used.

- The minimum mounting centers are applicable to switches with one layer of contact blocks (two contact blocks).
When two layers of contact blocks are mounted, determine the minimum mounting centers in consideration of convenience for wiring.

## Applicable wiring

(1) The applicable wire size is $2 \mathrm{~mm}^{2}$ maximum. (single wire $\varnothing 1.6$ $\mathrm{mm} \varnothing 0.063$ in maximum) One or two wires can be connected.

- Applicable crimping terminal (Unit: mm in) When using direction (A)

When using direction (B)

Be sure to use an insulation tube or cover on the crimping part of the crimping terminal to prevent electrical shocks.

- Single wire (Unit: mm in)

Note: When connecting wires to contact blocks or transformers in the direction (B), keep the insulation stripping length 6.6 mm 0.260 in at the maximum.
(2) Tighten the M3.5 terminal screws to a torque of 1.0 to $1.3 \mathrm{~N} \cdot \mathrm{~m}$.

## Using the lever lock (accessory)

- Please attach the lever lock (yellow) after locking to prevent personnel from forgetting to lock the lock lever.

SG-D1 series
Dimensions (Unit: mm in)

SG-D1-■ Key selector switch

Note: Please attach the lever lock (yellow) after locking to prevent personnel from forgetting to lock the lock lever.

SG-ET1 Locking ring wrench (optional)
