Handling Guidelines

- If a fixed-charging method is applied, please adhere to the specified charging voltage. Guaranteed voltage is 2.8V to 3.3V at the temperature of -20°C to 60°C.**

If the charging voltage exceeds the specifications, the internal resistance of the battery will rise and may cause battery deterioration.

Also with a charge voltage around 4V, corrosion of the positive(+) terminal (case) may occur causing leakage. It is not possible for the battery to recover completely when the charging voltage is below the specification.

- Under no circumstances trickle charging should be used.**

Ignoring this precaution will cause the battery voltage to rise to about 5V, resulting in a deterioration of performance.

Please feel free to ask a Panasonic sales person.
